## 7.1.2 Annexure (C1): Water Conservation facilities available in the institutions:

### Rain water Harvesting

Water harvesting refers to the practice of collecting and utilizing rainwater that falls on a specific area, known as a catchment, for various purposes. It involves capturing, storing, and managing rainwater for immediate use or for future needs.

The benefits of water harvesting include reducing water scarcity, replenishing groundwater reserves, improving agricultural productivity, and mitigating the impacts of droughts. It is an important technique for sustainable water management, particularly in areas with limited freshwater resources or unreliable rainfall patterns.
